Terrà un seminario dal titolo:
“From Analogue to Emergent gravity: lessons and pitfalls”

Abstract: The analogue gravity framework uses condensed matter systems to simulate phenomena characteristics of quantum field theory in curved spacetimes (e.g. cosmological particle production or black hole evaporation). In this seminar I will review the state of this field and explore its extension towards the simulation of the emergent gravity paradigm. In doing so I will discuss lessons and pitfalls as well as the possible phenomenology associated to these models.
